The data analysis and data management solutions provider, Datacapture, is releasing the new version of DataLab statistical data management application designed to help businesses analyse and manage their data. The first version of DataLab is designed to help the user understand and interpret his data and to extract important information from it through the visualization of data. With DataLab, you can perform several tasks, including data reading, data manipulation, parameter management and data storage or visualization of data. You can also define what kind of data is in your data set and how to store it in the best way. This application provides you with a set of tools that let you manage and transform your data at each phase of your project. After these steps are done, you can choose the most appropriate method for viewing and presenting your data. After implementing these methods, you can export all your results for further treatment. You can manage your project, making a script of any required actions, creating templates, using XSLT in order to convert your results into the desired format, and more. You can also connect with DataLab through VB6 or VB.NET Data Tools dll, or via a COM interface, creating and using a XML file as input, in order to make all the functions accessible and to transform any information in XML format. Using DataLab, you can: Read data from a dataset in a format chosen by the user. Read data from a text file or XML document. Perform mathematical operations on datasets. Perform conditional operations on tables. Perform statistical operations on datasets. Define a range of quantitative data, including intervals and proportions. Define a range of categorical data. Perform a conversion of a dataset to another kind of format, from one to another. Run tests on data and define conditions for testing. Analyse data quality. Use tables. Perform column or row filtering. Create column or row selectors. Define and manage columns and rows. Perform table operations on tables. Make table operations on records. Convert data to a tab-delimited, Comma Separated Value or any other format. Choose the format of

the table output. Define and print out a report. Choose the type of the report output. Create basic or complex tables. Define a range of data in a chart. Create a chart or a bar chart. Perform
